

## Fluoride Strengthens Teeth

### Materials Needed

- Two hard-boiled eggs
- Fluoride gel or solution, 4 to 6 oz. (from dental office)
- Three clean plastic containers
- Several cans of dark soda
- Water

### Process

1. Place a hard-boiled egg in one of the plastic containers and cover it with the fluoride gel or solution. Let the egg soak in the fluoride for twenty-four hours. Remove the egg and rinse it with water.
2. Place this “treated” egg in one of the two remaining clean containers, and place the “untreated” egg in the other.
3. Cover both eggs with dark soda. Change the solution every twelve hours for two days.

### Conclusion

The “untreated” egg will begin to dissolve slightly, and the shell will become stained by the dark soda. The “treated” egg should not show a reaction until much later. Thus, the conclusion could be drawn that the use of fluoride helps strengthen teeth and protect them from decay.

Note: with any science experiment, it is recommended that an adult be present for supervision.
